NEW ORLEANS

New Orleans, LA 70148 USA

TEMPORAL GRAPH

- powerful representation of various social, biological and technological dynamic systems
 - Social interactions and human activities,
 - appearance and disappearance of links in the Web,
 - patterns of interactions among genes
 - patterns of interactions in functional brain networks
- Complex system

APPLICATIONS

- Diffusion and propagation in complex and social networks
 - spread of viruses through a community
- Understanding communication networks
 - false news propagation
- Improving transportation systems
 - route-planning algorithms depending on the traffic with varied time
- Neuron (brain) network analysis
 - Locating key neurons in cortical networks

MOTIVATION & CHALLENGES

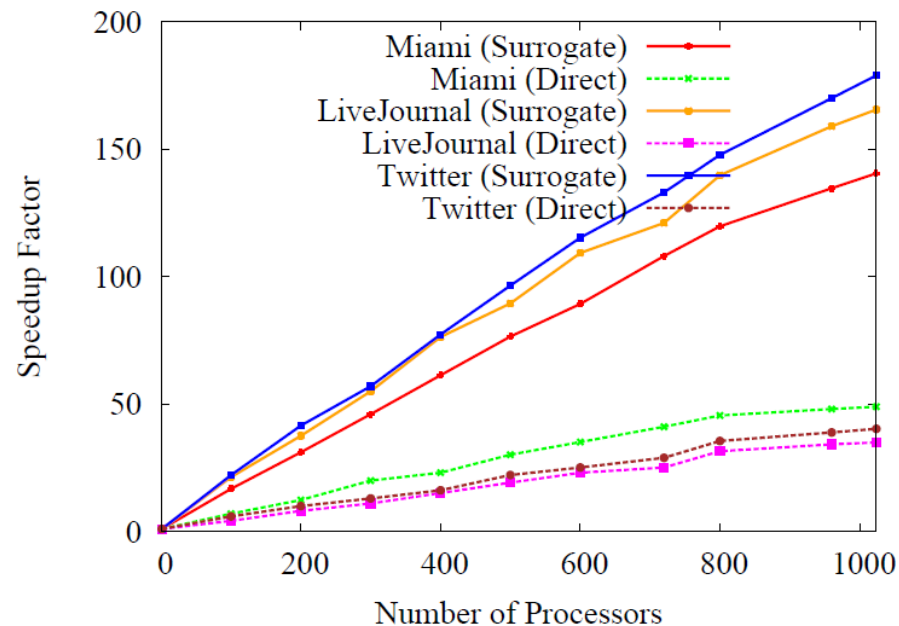

- defining and computing various temporal network metrics
 - classic studies' analysis of the topological properties of static graphs
- emergence of network big data
 - massive networks often do not fit in the main memory of a single machine
 - prohibitively large runtime for existing sequential methods

OUR APPROACH

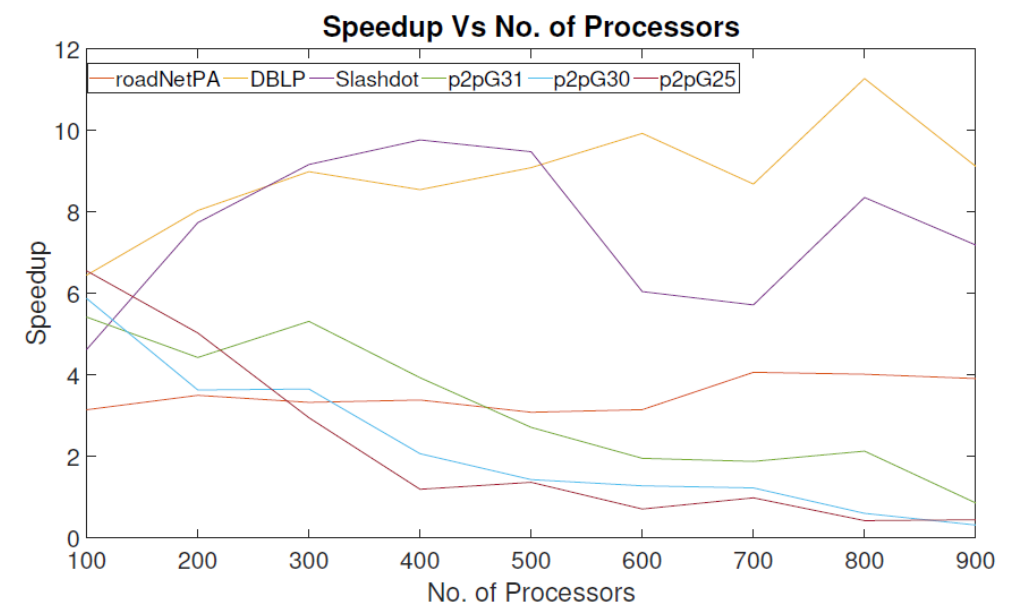

- Designing scalable algorithms
- Metrics
 - Computing path
 - Centrality
 - Communities

OUR SCALABLE ALGORITHMS FOR STATIC GRAPH

**DISTRIBUTED-MEMORY
PARALLEL ALGORITHMS FOR
COUNTING AND LISTING
TRIANGLES IN BIG GRAPHS**

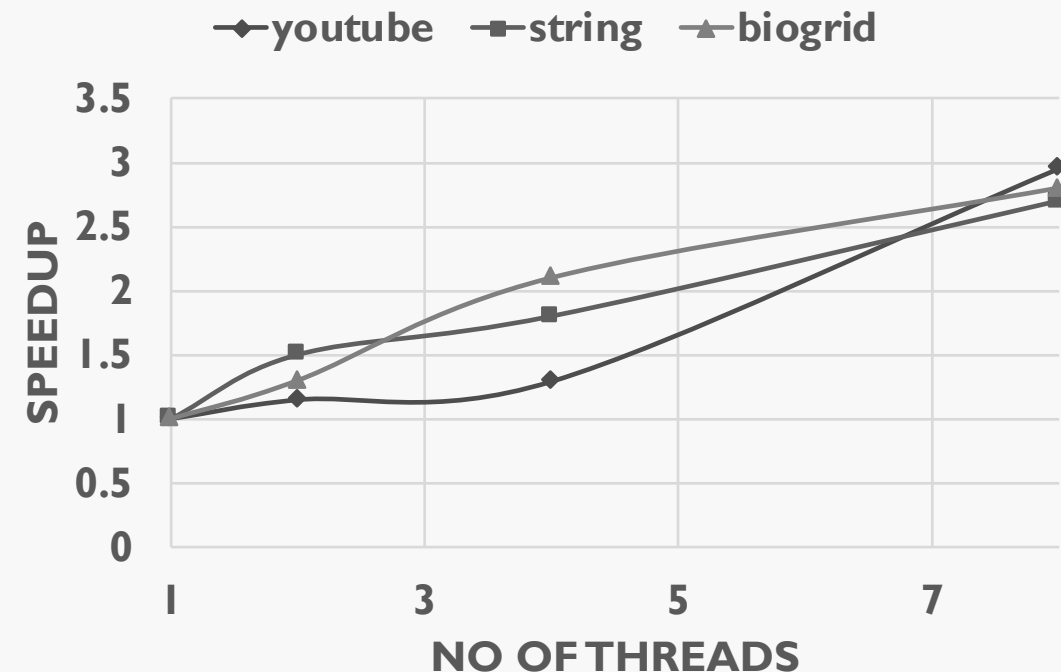

**DPLAL (DISTRIBUTED PARALLEL
LOUVAIN ALGORITHM WITH
LOAD-BALANCING) TO DETECT
COMMUNITIES**

OUR MULTI-THREADED ALGORITHM FOR DYNAMIC GRAPH

Speedup factors of
our multithreaded
shortest path
algorithm

SPEEDUP VS NO OF THREADS

FUTURE WORKS

Parallelize existing sequential temporal networks mining and computation of network metrics

- Efficient load balancing
- Communication schemes
- Data reduction (e.g., graph sparsification and approximation)
- Efficient formalization of temporal metrics
